Henry Ford Dearborn, Mich.

IN ANSWER TO A LADY'S LETTER

A lady writes to say that she does not understand why an 8-cylinder car does not cost more to run than a car with fewer cylinders. She refers to my statement that our Ford V-8 develops more power on a gallon

of gas than any car we have made. The use of 8-cylinders does not mean the addition of two or four extra fuel consumers. It is not, for example, a 4-cylinder engine multiplied by two. Our 8-cylinder engine takes the fuel supply of an ordinary 4-cylinder engine and divides it eight ways. And why?

By reducing four larger explosions into eight smaller ones, we get engine smoothness and quietness. Eight-cylinders indicate the way the gas is used, not the amount. It is just the difference between going upstairs in four long jumps or in eight ordinary steps.

Two things use up gas—bad engine design and useless car weight. Besides having an engine that gets a high percentage of power out of the fuel, the Ford V-8 has a light, strong body and chassis so that no power is wasted in moving excess weight.

The only extravagance about the new Ford V-8 engine is in the building of it. The extravagance is ours—the economy is yours.

The whole question of car economy needs clearing up. An economical car gives economy all round. Price, operation, upkeep, all play their part. If what you save on gas you lose elsewhere, that is not economy. As to upkeep, our dealers say that in recent years the improved

quality of Ford cars has cut down their repair business 50 per cent. As to price with quality, - judge for yourself. As to economy, here is the record of a stock car three weeks out of

shop in Oklahoma: On a run of 10,054 miles at the rate of 1,000 miles a day-the Ford V-8 gave 18.8 miles per gallon of gas. Not a drop of water was added to the radiator. The oil was changed once in 1,000 miles.

That should answer a lot of questions.

July 24th, 1933
